07/15/16

Dear Data Sync Partner,

Below is important information on our Ti/Hi requirements. Please follow the below requirements.

Publishing Case GTINs to SUPERVALU When You Have Multiple Pallet Configurations

If your company sells multiple configurations of the same case GTIN, your sales team should work with our regional merchants to determine which configuration each of our DC's will be purchasing and only publish the requested pallet configuration. If you have published a configuration that we are not purchasing, you should un-publish these pallet GTINs.

Using nonGTINPalletTi/Hi verse using Ti/Hi requirements

- Either Ti/Hi or nonGTINpalletTi/Hi (but not both) should always be present on the topmost GTIN of your publications.
- When your topmost GTIN is a pallet or mixed module, specify **only** the regular Ti/Hi attributes. We prefer to receive pallet GTINs whenever possible.
- When your topmost GTIN is **not** a pallet or mixed module (for instance, a case or display GTIN), specify **only** the nonGTINPalletTi/Hi attributes.
- The attribute names we're referring to are the 1WorldSync XML names - you may need to work with your solution provider to determine which attributes to populate on which GTINs.

More information on data sync with SUPERVALU can be found on our landing page HERE.
